Capsule Geology

Galena and sphalerite occur in siderite veins and poddy replacement lenses in Lower Cambrian limestone and phyllite near the contact of the Cassiar Batholith. Grab samples from a zone 3.0 to 8.0 cm thick gave values of 744.7 g/t Ag, 8.0% Pb and 6.8% Zn. Air photo studies demonstrated that the known showings lie along a northwest-trending lineament.
