

Occurrence Details

Occurrence Number: 105B 123

Occurrence Name: Head

Occurrence Type: Hard-rock

Status: Anomaly

Date printed: 4/29/2025 4:03:33 PM

General Information

Secondary Commodities: gold, lead, silver

Aliases: Tackle

Deposit Type(s): Manto Polymetallic Ag-Pb-Zn

Location(s): 60°10'11" N - -130°21'45" W

NTS Mapsheet(s): 105B01

Location Comments: 1 Kilometres

Hand Samples Available: No

Last Reviewed:

Capsule

Work History

Staked as Head cl 1-42 (YA70822) in Jan/84 by Canamax Resources Inc, which carried out geological mapping, grid soil sampling and staked Head cl 43-56 (YA71013) in May/84. Canamax extend geochemical coverage in the area with addition grid soil sampling in Jul/86. First Yukon Silver Resources Inc tied on to the south of the remaining 14 Head claims, staking Ed cl 1-14 (YB00526) in Jul/87. First Yukon carried out reconnaissance soil sampling in 1988. Restaked as Tackle cl 1-48 (YB75398) by Nordac Resources Ltd in Feb/96. Nordac carried out a work program consisting of geological mapping, prospecting, grid soil sampling and hand trenching, before adding Tackle cl 49-64 (YB87360) in Sep/96. Nordac Resources Ltd was reorganized in Jun/01 and renamed Strategic Metals Ltd.

Capsule Geology

A circular magnetic anomaly is associated with a narrow, biotite-rich granite dike that cuts a gently east-dipping sequence of Lower Cambrian carbonate, phyllite and quartzite. Calc-silicate hornfels with traces of pyrite and pyrrhotite was found as float. Two northeast trending silver-lead-zinc anomalies with samples returning up to 6 ppm Ag, 3 840 ppm Pb and 700 ppm Zn were defined in an area where fracture-filling galena was found in massive limestone. Resampling in 1996 returned 71.0 ppm Ag and >10 000 ppm Pb from a hand pit located near an anomalous 1986 soil sample site. A specimen of quartzite containing vuggy quartz veining with traces of limonite and pyrrhotite assayed 1.15% Pb, 304 g/t Ag and 30 ppb Au.
