

Occurrence Details

Occurrence Number: 105D 105

Occurrence Name: Fish Lake

Occurrence Type: Hard-rock

Status: Showing

Date printed: 4/29/2025 4:40:49 AM

General Information

Secondary Commodities: coal

Deposit Type(s): Coal

Location(s): 60°31'22" N - -135°20'18" W

NTS Mapsheet(s): 105D11

Location Comments: .5 Kilometres

Hand Samples Available: No

Last Reviewed:

Capsule

Work History

Discovered in 1969 by Luscar Ltd while it held the surrounding area as Coal Exploration Licence 5. T. Morgan staked the Duck cl (YB25709) 4 km to the northeast in April, 1990.

Capsule Geology

Coal bloom was seen in black shale of the Jurassic-Cretaceous Tantalus Formation. One poor quality seam is apparently present.

The Duck claims covered an area of quartz-carbonate veining and pyritic hornfels along the contact between Cretaceous granodiorite and sedimentary rocks of the Jurassic Laberge Group. No samples from these claims were analysed.
