

Occurrence Details

Occurrence Number: 105F 004
Occurrence Name: Gopher
Occurrence Type: Hard-rock
Status: Prospect
Date printed: 12/16/2025 3:20:39 PM

General Information

Secondary Commodities: gold, lead, molybdenum, silver, zinc
Deposit Type(s): Vein Polymetallic Ag-Pb-Zn+/-Au
Location(s): 61°2'45" N - -133°47'19" W
NTS Mapsheet(s): 105F04
Location Comments: .5 Kilometres
Hand Samples Available: No
Last Reviewed:

Capsule

Work History

This area was extensively prospected and staked in the 1920's and an adit had been driven on this showing in 1934 when it was first visited by the GSC. The early claim records have not been found.
Staked by J. Mohagen in Aug/53 as Red cl (66549) and in Mar/65 as Gopher cl (92660), which were sold to Boswell River ML later in the year. Boswell performed mapping, geochem and geophysical surveys and limited hand trenching in 1966-68. Restaked as Bug cl (YA7996) in Aug/76 by Tintina Silver ML, and as Chess cl (YA48250) in Sep/79 by Golden Empire ML, which performed linecutting and trenched in 1980 and 1981 and mapping, geochem sampling and road construction in 1982.
Skagway Moly Inc added Moly cl (YA74202) to the west in Oct/81, changed its name to Shakwak ECL, and performed bulldozer trenching in 1982. Restaked as RG cl (YB24070) in Oct/88 by Dominion E Inc.
Restaked as Charm cl 1-16 (YB66577) by 13744 Yukon Inc in Feb/96.

Capsule Geology

Galena occurs in quartz lenses within a thin (1-2 m) dolomite horizon at the contact between a tuff unit to the south and quartz-sericite schist to the north that resembles the Klondike Schist of Paleozoic age. The following assays have been reported:

Type	
Width (cm)	
Ag (g/t)	
Pb (%)	
Zn (%)	
Au (g/t)	
lens in dolomite

The workings cover a strike length of about 180 m and EM surveys traced the structure for a further 305 m. The Moly claims were staked to cover an occurrence of molybdenite in quartz feldspar porphyry dykes.
