

Occurrence Details

Occurrence Number: 105F 008
Occurrence Name: Tower Peak
Occurrence Type: Hard-rock
Status: Showing
Date printed: 12/16/2025 7:55:21 PM

General Information

Secondary Commodities: copper, silver
Deposit Type(s): Vein Polymetallic Ag-Pb-Zn+/-Au
Location(s): 61°16'49" N - -133°11'41" W
NTS Mapsheet(s): 105F06
Location Comments: .5 Kilometres
Hand Samples Available: Yes
Last Reviewed:

Capsule

Work History

Staked as Dell, etc cl (70114) in Mar/55 by Bell Asbestos as part of a large claim block around the Ryhorchuk showing. Bell built a road to the property and bulldozer trenched in 1955. Restaked as TP, etc cl (Y36431) in Aug/69 by Cassiar Asbestos Corp L; as Copper cl (Y36451) in Aug/69 by D. Baird, who did some hand trenching in 1970; and as DDH cl (Y75402) in Apr-May/73 by D. Lampert and H. Roch, who trenched in 1974 and 1976. Restaked as Jim Dandy cl (YA23099) in Aug/78 by R. Lacombe and fringed as Tower cl (YA23937) in Jan/79 by B.A. Copper ML, which explored with bulldozer trenching in 1979 and mapping and geochem sampling in 1981.

Capsule Geology

Rocks of two distinctly different terranes occur on the property, separated by a thrust fault. Silurian-Devonian sedimentary rocks of the Nasina Series lie to the southwest while mafic volcanic and metavolcanic rocks of the Anvil-Campbell Allochthon lie to the northeast. Three types of mineralization have been found on the property. (1) Low-quality asbestos fibre occurs in serpentinized ultramafic rocks of the allochthon on the Jim Dandy claims. (2) A small chalcocite veinlet cuts a green volcanic rock nearby. A channel sample assayed 2.5% Cu and 1.1 ppm Ag across 20 m. (3) Disseminated pyrite, chalcopyrite and minor galena are associated with a zone of quartz veining and silicification.
