

Occurrence Details

Occurrence Number: 105F 014

Occurrence Name: Sonny

Occurrence Type: Hard-rock

Status: Prospect

Date printed: 12/16/2025 7:37:20 AM

General Information

Secondary Commodities: arsenic, copper, gold, lead, silver

Deposit Type(s): Vein Polymetallic Ag-Pb-Zn+/-Au

Location(s): 61°28'41" N - -132°17'38" W

NTS Mapsheet(s): 105F08

Location Comments: .5 Kilometres

Hand Samples Available: No

Last Reviewed:

Capsule

Work History

Staked as Rain cl (71341) in Sep/55 by British Yukon Exploration Ltd, which conducted mapping, rock trenching and sampling in 1956-57. Staked by P. Verslue as Grey cl (79545) in Jul/62, as Calco and Sonny cl (88979) in Oct/64, and as Sunny cl (Y13292) in Jul/66. The Sharon cl (Y17688) were tied on to the east side by Northwest Exploration Ltd (International Utilities and Hudson's Bay Oil & Gas Company Ltd) in Apr/67, which performed prospecting and geochemical sampling in Aug/67. Verslue added the PH cl (Y28688) to the west and southeast in Oct/68.

Staked as Reo 1-12 cl (YA46895) in Feb/80 by I. Jacobsen, who added a second group of Reo 25-32 cl (YA46919) 3.2 km to the east, and as Jo cl (YA70320) in Aug/83 by M. Tremblay. Staked as Pizza cl (YA90283) in Sep/85 by Cruiser Minerals Ltd, and as St Peter, Jessie, Sonny, GP, etc (YA99516) in Oct/87 by Golden Pavilion Resources Ltd, which carried out mapping, geochemical sampling, magnetic and VLF EM surveys, and hand trenching in 1987.

Restaked as Riba cl 1-6 (YB60978) by R. Berdahl in Aug/95. Berdahl prospected and sampled various mineralized showings located on the claim block.

Capsule Geology

The Ketza River district is predominantly underlain by thick (400m or greater) successions of calcareous sedimentary rocks ranging in age from lower Cambrian to Mississippian. The calcareous units are host to veins containing argentiferous galena and to gold rich mantos. The latter occur below an unconformity within lower Cambrian limestone and the former occur throughout the calcareous members above the unconformity. The area has undergone at least five major deformational events. Fonseca (1998) attributes the gold rich manto, magnetite-gold skarns, veins and oxide gold occurrences and deposits to mineralizing fluids ascending D4 deformation event structures. The source of the mineralizing fluids is uncertain. The only igneous rocks exposed in the area are Mississippian age volcanic and intrusive rocks which have no spacial association with the ore bodies. Fonseca, (1998) suggests there is sufficient evidence, a mid-Cretaceous intrusion sits unexposed beneath the Ketza Uplift providing a probable heat source to drive the mineralizing fluids.

Siderite mantos and chimneys containing minor pyrite, pyrrhotite, chalcopyrite, arsenopyrite and galena occur in Lower Cambrian limestone and dolomite. Six main showings on the property marked by conspicuous gossans expose sulphide mineralization over a strike length of about 1 km. Quartz veins up to 2 m thick occupy fractures around the siderite bodies and contain minor amounts of sulphide minerals.

Rich tetrahedrite float assaying 17 800 g/t Ag is rumoured to have been found in this vicinity in 1955. No mineralization was found in 1967 although a small, well defined lead anomaly was outlined on the Chalco 4 and 5 claims.

The 1987 work located 35 showings, 25 of which are mantos. The best explored manto is the main zone, it is 1.2 km long and averages about 8 m wide. It is marked by conspicuous gossans and covers a string of showings, including the Ridley, Main, Gray and Young showings. The mineralogy changes along strike from siderite, pyrite and pyrrhotite with high gold values at the Ridley and Main showings, to pyrite, arsenopyrite, pyrrhotite and galena with high silver values at the Young and Gray showings.

Trenching on the Main showing exposed material grading up to 9.9 g/t Au, while samples from the Gray showing returned up to 274.3 g/t Ag and 1.5% Pb. Soil geochemistry indicates that the highest grade part of this manto lies between the Gray and Young showings and is more than 300 m long.

Two other areas of possible economic significance include the Jessica and Sonny showings. The Jessica showing is a 14 x 250 m siderite chimney with a 5 m wide core of massive sulphides including chalcopyrite, pyrrhotite and arsenopyrite. Elevated gold values are associated with the mineralized core. At the Sonny showing, massive siderite with pyrite is coincident with a large magnetic anomaly and anomalous values of gold, arsenic, silver, zinc, lead and iron in soil. Some of the massive quartz veins also show economic potential, as they have elevated gold values and often grade into manto deposits along strike. A 1-2 m wide quartz vein adjacent to the Ridley showing contains over 1% Cu.

Berdahl prospected and sampled all of the significant showings located on the claim block. Geochemical results reaffirmed that the mainly massive siderite, oxide and massive pyrrhotite showings are anomalous in Au, As, Ag, and Cu.
