

## Occurrence Details

**Occurrence Number:** 105G 046  
**Occurrence Name:** Tag  
**Occurrence Type:** Hard-rock  
**Status:** Unknown  
**Date printed:** 12/16/2025 3:19:42 PM

## General Information

**Deposit Type(s):** Unknown  
**Location(s):** 61°40'16" N - -131°51'27" W  
**NTS Mapsheet(s):** 105G12  
**Location Comments:** 1 Kilometres  
**Hand Samples Available:** No  
**Last Reviewed:**

### Capsule

#### Work History

Staked as Tag cl (88091) by Newmont in Apr/63.

#### Capsule Geology

Geological mapping (Murphy et al., 2001) shows the region is dominantly underlain by a layered sequence of Devonian to Early Mississippian metavolcanic and metasedimentary rocks of the Yukon-Tanana Terrane (YTT) that have been intruded by Mississippian granitic intrusions and later Cretaceous and Jurassic intrusions. The YTT is a volcanic-plutonic pericratonic arc assemblage that was strongly deformed and metamorphosed by Late Triassic time. Volcanic-hosted massive sulphide deposits exist at different stratigraphic positions within the YTT.

These claims occur in an area of extensive overburden with scattered outcrops of Eocene volcanic rocks. The claims were probably staked on the basis of an aeromagnetic survey, which shows a very complex pattern.
