

Occurrence Details

Occurrence Number: 105H 072

Occurrence Name: Woah

Occurrence Type: Hard-rock

Status: Prospect

Date printed: 12/18/2025 12:03:01 PM

General Information

Secondary Commodities: tungsten

Deposit Type(s): Skarn W

Location(s): 61°50'35" N - -129°11'52" W

NTS Mapsheet(s): 105H14

Location Comments: .5 Kilometres

Hand Samples Available: No

Last Reviewed:

Capsule

Work History

Staked as WOAHL d (YA25740) in Sep/77 by Welcome North ML, which explored with mapping and sampling in 1977 and 1978. Riocanex explored in 1979 with rock geochem sampling and 4 holes (191 m) under a brief option. In 1981, the property was optioned briefly to Union Carbide EL.

Capsule Geology

Four scheelite showings occur in garnet-diopside-quartz skarn developed in screens and xenoliths of Proterozoic limestone and limy phyllite along the margin of the Mt Billings Batholith. The mineralization tends to be deficient in sulphides although pyrrhotite, pyrite, chalcocopyrite and sphalerite are locally present in minor amounts. Quartz veins cutting the skarn contain scheelite, molybdenite, chalcocopyrite and anomalous amounts of radioactive minerals. Chip sampling of the best scheelite occurrence (A showing) in 1977 indicated an average grade of 0.4% WO₃, but the 1979 surface sampling returned an average grade of 0.09% WO₃. Drilling failed to intersect the Woah A mineralization. The best intersection from the Woah B assayed 0.02% WO₃ over 29.7 m.
