

## Occurrence Details

**Occurrence Number:** 105H 073  
**Occurrence Name:** Tai  
**Occurrence Type:** Hard-rock  
**Status:** Prospect  
**Date printed:** 6/16/2025 12:30:46 PM

## General Information

**Secondary Commodities:** tungsten  
**Deposit Type(s):** Skarn W  
**Location(s):** 61°49'13" N - -129°2'25" W  
**NTS Mapsheet(s):** 105H14  
**Location Comments:** .5 Kilometres  
**Hand Samples Available:** No  
**Last Reviewed:**

### Capsule

#### Work History

Staked in Sep/77 as Tai cl (YA25762) by Welcome North ML, which conducted mapping and sampling in 1977 and 1978. Riocanex explored with rock geochem sampling and 2 drill holes (160.6 m) in 1979 under a brief option. In 1981, the property was optioned to Union Carbide EL.

#### Capsule Geology

The showings consist of scheelite in garnet-diopside-quartz skarn that has developed in migmatized Proterozoic limy phyllite and limestone along the complex and indistinct margin of the Mt Billings Batholith. The skarns tend to be sulphide-deficient although minor amounts of pyrrhotite, sphalerite, magnetite and chalcopryrite are locally present. Molybdenite occurs with scheelite, magnetite and chalcopryrite in quartz veins that cut the skarn. The northernmost showing, called Tai West, consists of a 30 m thick skarn zone that outcrops for over 600 m and contains very low grade scheelite. The other three showings (collectively called Tai East) consist of very narrow skarn bands. The middle showing, which is the best, returned average chip sample assays of 0.04% WO<sub>3</sub>. The best drill intersection was 0.02% WO<sub>3</sub> over 15 m.
