Work History

Staked as BS cl 1-24 (86062) in Apr/64 by Kerr Addison Mines Ltd on the north side and within a large block of Sea claims (86133) in May/64 by Dynasty Explorations Ltd on the south side. Dynasty carried out an airborne magnetometer and EM survey, gravity and geochemical surveying and drilled 4 holes (442 m) in 1964 before entering a joint venture with Cyprus Exploration Ltd and forming a new company, Anvil Mining Corporation Ltd in 1965. Anvil drilled 7 rotary holes (1 161 m) early in 1965; 1 core hole (301 m) in 1968 about 1.6 km to the southeast; 4 rotary holes (117 m) in 1970 about 2.5 km to the east; and 9 scattered rotary holes (364 m) in 1971. Kerr Addison drilled 3 holes (458 m) in 1973. Anvil reorganized as Cyprus Anvil Mining Corporation Ltd in 1975 and carried out a Turam survey in 1977. In 1978, Kerr Addison sold the BS group to Cyprus Anvil, which drilled 1 hole (319 m) on BS cl 11 in 1979. The claims were sold in 1985 to Curragh Resources Inc, which drill-tested geophysical anomalies with three widely spaced holes (523 m) in 1988. In Nov/94 Anvil Range Mining Corporation acquired all claims owned by Curragh following the bankruptcy of the latter. In Feb and Mar/96 Anvil Range drilled a line of 6 widely spaced diamond drill holes (1 056 m) in the Swim Lake Basin. The drill holes were collared on various Sea and adjoining Pod claims. In Jan/98 Anvil Range filed for court protection in order to restructure the company. In Jan/99 Anvil Range's stock was delisted and the company entered bankruptcy proceedings.

Capsule Geology

The original staking target was an airborne magnetic anomaly. The 1965 drill results show the presence of pyrite and pyrrhotite lenses assaying up to 1% Pb, 1.4% Zn and 0.4% Cu. One grab sample from a trench assayed 4.8% Pb, 6.9% Zn and 24.0 g/t Ag, while another from an outcrop at the east end of the anomaly assayed 7% Cu and 102.9 g/t Ag. The best intersection in the 1964 and 1966 drilling was 2 % Zn, 1.7% Pb, 13.7 g/t Ag and about 0.3% Cu across 4.1 m in Hole 6. Overall grades are reportedly quite low from a sulphide deposit consisting of lenses and stringers of sulfides with limited downdip continuity that is hosted by distinctive siliceous and graphitic phyllites of the Lower Cambrian Mount Mye formation. Curragh's 1988 drillholes did not intersect mineralization. All six holes drilled by Anvil Range Mining Corp intersected varying amounts of fine grained disseminated pyrite and/or pyrrhotite but none of the holes intersected massive sulphide mineralization. Hole 96-6 intersected substantial black calcareous schist which may represent the ore bearing horizon at the contact between the Mt. Mye and Vangorda Formation but no massive sulphides were observed. All of the holes were assayed but the results were never filed for assessment credit.
