Work History

Staked as BS cl 1-24 (86050) by Kerr Addison Mines Ltd in Apr/64 following an airborne magnetometer survey. Fringe staked to the north as Sea cl 1-72 (86133) by Dynasty Explorations Ltd.

Kerr Addison carried out ground magnetometer, EM, SP and gravity surveying and drilled 4 holes (308 m) in 1965 and 6 holes (758 m) in 1967. The west end of the BS group was restaked as SB cl 1-18 (Y75810) in Jul/73 by Anvil Mining Corporation Ltd, which drilled 1 hole (194 m) north of Swim Lake later that year and 5 holes (814 m) in 1974. In 1975 Anvil was reorganized as Cyprus Anvil Mining Corporation. Cyprus Anvil drilled 4 holes (1 096 m) in 1975; 5 holes in 1976 (1 419 m); 1 hole (337 m) on Sea cl 9 in 1978; 1 hole (780 m) on Lea cl 16 in 1980; 1 hole (493 m) on Pea cl 1 and 1 hole (434 m) on Sea cl 12 in 1981.

The claims were sold in 1985 to Curragh Resources Inc and in 1989, Curragh prepared orthophoto maps of the Swim Basin area. In Nov/94 Anvil Range Mining Corporation acquired all claims owned by Curragh following the bankruptcy of the latter.

Anvil Range undertook a compilation study, between Aug/97 and Feb/98, to gather together all known geological data, including standardizing geological map units and accurately locating drill holes located within and surrounding their claim holdings. Only two reports, one of which covers claims assigned to this occurrence, were completed before Anvil Range encountered financial difficulties and terminated the project.

In Jan/98 Anvil Range filed for court protection in order to restructure the company. In Jan/99 Anvil Range's stock was delisted and the company entered bankruptcy proceedings.

Capsule Geology

Overall grades are reportedly quite low from a large sulphide deposit with limited downdip continuity which is hosted by distinctive ribbon-banded and graphitic phyllite in the lower part of the transition zone between non-calcareous phyllite of the Lower Cambrian Mount Mye formation and overlying calcareous phyllite of the Cambrian to Ordovician Vangorda formation. The initial drilling intersected narrow lenses of pyrite, pyrrhotite and magnetite containing some galena, sphalerite and chalcopyrite in sericitic and graphitic schist. The 1980 and 1981 holes were drilled for stratigraphic purposes and cut unmineralized phyllite, metabasite and a diorite dyke.
