

## Occurrence Details

**Occurrence Number:** 105L 022

**Occurrence Name:** Tummel

**Occurrence Type:** Hard-rock

**Status:** Showing

**Date printed:** 12/16/2025 5:58:41 AM

## General Information

**Secondary Commodities:** tungsten

**Deposit Type(s):** Skarn W

**Location(s):** 62°32'50" N - -134°48'57" W

**NTS Mapsheet(s):** 105L10

**Location Comments:** .5 Kilometres

**Hand Samples Available:** No

**Last Reviewed:**

### Capsule

#### Work History

Discovered by prospecting and staked as Bull cl (Y25735) in Aug/68 by Union Carbide. Only sampling and preliminary evaluation was done.

#### Capsule Geology

Scheelite occurs in alternating layers of diopside-garnet skarn and hornfels developed in Lower Cambrian metasedimentary rocks. It is best developed near the north contact of a poorly exposed quartz monzonite dike. Grab samples from an outcrop 3 by 2 m assayed as high as 1.56% WO<sub>3</sub>. The associated sulphide content is negligible. The GSC noted pyrrhotite zones nearby.
