Capsule Geology

The region is underlain by a metamorphosed and altered sequence of Early Proterozoic Wernecke Supergroup clastic and carbonate rocks (Fairchild Lake Group, Quartet Group and Gillespie Lake Group, from oldest to youngest) that are intruded by Early to Middle Proterozoic mafic sills and dykes, and cut by Middle Proterozoic Wernecke Breccia. Chalcopyrite occurs in an east striking quartz vein up to 3.7 m wide and in thin subsidiary quartz stringers on the south side. The vein, which is exposed for a length of about 60 m, occurs near a regional fault and cuts Quartet Group argillite.
