

Occurrence Details

Occurrence Number: 106C 076

Occurrence Name: Otter

Occurrence Type: Hard-rock

Status: Prospect

Date printed: 12/16/2025 9:31:51 PM

General Information

Secondary Commodities: cobalt, copper, gold, nickel, silver, uranium

Deposit Type(s): Iron Oxide Breccias & Veins (Wernecke Breccias)

Location(s): 64°59'10" N - -133°48'2" W

NTS Mapsheet(s): 106C13

Location Comments: .5 Kilometres

Hand Samples Available: No

Last Reviewed:

Capsule

Work History

Staked as the Otter cl 1-4 (YA15886) in Aug/77 by Mountaineer Mines Ltd and optioned to Pan Ocean Oil Ltd, which added Otter cl 5-36 (YA38210) in Sep/78, Otter cl 37-88 (YA40567) in Aug/79 and Otter cl 89-124 (YA41306) in Oct/79. The company conducted mapping, geochem sampling and radiometric surveys in 1978 and 1979, and drilled 4 diamond drill holes (603 m) in 1979. In 1980 Pan Ocean added Vole cl 1-43 (YA41955) to the north and drilled 4 diamond drill holes (140 m) on the Otter group and 4 holes (340 m) on the Vole group. The Otter 1-40 cl (YB42249) were restaked adjacent to the Slab claim block in Oct/93 by a joint venture consisting of Pamicon Developments Ltd, Equity Engineering Ltd and Westmin Resources Ltd. The joint venture group transferred 100% interest in the Otter claims to Westmin Resources Ltd. in Jan/94. In early 1994 Westmin entered into a joint venture with Newmont Exploration Ltd and in June they contracted Pamicon and Equity to carry out soil and stream sediment sampling, rock geochemistry and limited geological mapping on the Slab cl 209-212 (YB22343) and Otter cl 1-40 (YB42249). As part of their exploration program on the Fair claims, Pamicon carried limited mapping and rock sampling on Otter cl 34-40. In Jul/95 Westmin staked Beav cl 1-4 (YB6442) 5 km to the north on map sheet 106F 04.

Capsule Geology

The region is underlain by a metamorphosed and altered sequence of Early Proterozoic Wernecke Supergroup clastic and carbonate rocks (Fairchild Lake Group, Quartet Group and Gillespie Lake Group, from oldest to youngest) that are intruded by Early to Middle Proterozoic mafic sills and dykes, and cut by Middle Proterozoic Wernecke Breccia. To the east, Wernecke Supergroup rocks are unconformably overlain by Middle Proterozoic Pinguicula Group rocks. According to Thorkelson (2000), Wernecke Breccia development is best modeled as a set of hydrothermal and/or phreatic breccias; brecciation being caused by explosive expansion of volatile-rich fluids. Hunt (2005) attributed Wernecke Breccia formation to periodic overpressuring of dominantly basinal fluids, which lead to repeated brecciation of host strata and mineral precipitation. Three vein clusters occur along a 4 km long northeast-trending shear zone that cuts Lower Proterozoic Fairchild Group limy argillite near a small body of Wernecke Breccia. The vein clusters are called Otter, Otter A and Otter B. Individual veins, which are up to 30 m long and 5 m wide, strike northeast, dip northwest (in the south) and contain cobaltite, chalcopyrite, pyrite and arsenopyrite in a carbonate gangue. Wall rocks contain disseminated sulphides. A 9 m intersection assayed 0.2% cobalt and 0.5% copper and the best intersection assayed 0.6% cobalt and 1.1% copper. The breccia body contains minor brannerite, and a specimen assayed 4.8% cobalt, 0.2% nickel, 0.007% uranium oxide (U₃O₈), 0.34 g/t silver and 0.062 g/t gold.
