

## **Occurrence Details**

Occurrence Number: 106C 096 Occurrence Name: Julie Occurrence Type: Hard-rock

Status: Showing

Date printed: 4/29/2025 4:15:37 PM

## **General Information**

Deposit Type(s): Iron Oxide Breccias & Veins (Wernecke Breccias)

Location(s): 64°53'48" N - -133°26'39" W

NTS Mapsheet(s): 106C14 Location Comments: .5 Kilometres Hand Samples Available: No

Last Reviewed:

## Capsule

### Work History

Thorkelson and Wallace (1995) reported this showing as Minfile Occurrence #106C 095.

Discovered during geological mapping program by Thorkelson and Wallace (1995). J. Hajek staked Bloom cl 1-38 (YB43576) to the north and west in Sep/94. The next year Hajek optioned the claims to West Lake Ltd which carried out a trenching and prospecting program later in the summer. Hajek staked the occurrence as BL cl 55-62 (YB65749) in Jul/96.

#### Capsule Geology

The region is underlain by a metamorphosed and altered sequence of Early Proterozoic Wernecke Supergroup clastic and carbonate rocks (Fairchild Lake Group, Quartet Group and Gillespie Lake Group, from oldest to youngest) that are intruded by Early to Middle Proterozoic mafic sills and dykes, and cut by Middle Proterozoic Wernecke Breccia. To the east, Wernecke Supergroup rocks are unconformably overlain by Middle Proterozoic Pinguicula Group rocks. According to Thorkelson (2000), Wernecke Breccia development is best modeled as a set of hydrothermal and/or phreatic breccias; brecciation being caused by explosive expanson of volatile-rich fluids. Hunt (2005) attributed Wernecke Breccia formation to periodic overpressuring of dominantly basinal fluids, which lead to repeated brecciation of host strata and mineral precipitation.

The occurrence consists of quartz-dolomite-pyrite and chalcopyrite veins associated with nearby zones of Wernecke Breccia. Two zones of veining about 5 m wide within the Fairchild Lake Group occur near the base of the cirque headwall. Abundant vein float suggests that the veins may also crop out higher on the cirque walls. The two best assays from vein material were 1.8 % copper, 0.42 gm/t gold; and 0.02 % copper, 0.02 gm/t gold.
