

Occurrence Details

Occurrence Number: 106E 020

Occurrence Name: Tuku

Occurrence Type: Hard-rock

Status: Prospect

Date printed: 12/17/2025 11:50:47 PM

General Information

Secondary Commodities: barite, copper, lead, silver, zinc

Deposit Type(s): Sediment hosted Mississippi Valley-Type Pb-Zn (MVT)

Location(s): 65°58'56" N - -135°23'55" W

NTS Mapsheet(s): 106E14

Location Comments: .5 Kilometres

Hand Samples Available: Yes

Last Reviewed:

Capsule

Work History

Staked as the Tuku and Ali cl Y89537) in Jul/74 by Amax, which explored by mapping and geochemical sampling in 1974 and 1975.

Capsule Geology

A fault block of Lower Cambrian micritic limestone is exposed through Middle and Upper Cambrian limonitic siltstone. The claims cover a fault zone up to 21.3 m wide that contains disseminated and massive galena, sphalerite, chalcopryrite and pyrite with barite and siderite.

The main showing is 90 m long and chip samples assayed 6.4% Zn and 3.0% Pb across a 3.7 m width and 0.16% Zn and 0.24% Pb across 5.2 m. Minor occurrences of galena, sphalerite and barite are found elsewhere along the fracture system.
