

Occurrence Details

Occurrence Number: 115I 117

Occurrence Name: Eastern Dickson

Occurrence Type: Hard-rock

Status: Prospect

Date printed: 6/14/2025 4:58:30 PM

General Information

Secondary Commodities: antimony, copper, gold, lead, silver, zinc

Aliases: Klaza, Dic

Deposit Type(s): Vein Polymetallic Ag-Pb-Zn+/-Au

Location(s): 62°6'48.94" N - -137°15'4.44" W

NTS Mapsheet(s): 115I03

Location Comments: Location provided by Rockhaven Resources 2019

Hand Samples Available: No

Last Reviewed:

Capsule

Work History

Staked as Dic cl 1-51 (YA93470) in September 1985 by Kerr Addison Mines Ltd., which explored with soil sampling, prospecting and ground magnetic and VLF-EM geophysical surveys and mapping and added Dic cl 52-63 (YA95111) in 1986. Optioned by Chesbar Resources Inc. and States Exploration Ltd., which performed bulldozer trenching in 1987 and 1988. The claims were transferred to Chesbar in March 1989.

In October 1989 the claims were transferred to G. Dickson to fulfil the obligations of an option agreement covering the neighbouring Vic claims (MINFILE occurrence 115I 068). Dickson performed trenching in 1990.

Re-staked as Eagle cl 1-12 (YB35415) in October 1990 by G. Dickson who also staked Dic cl 101-106 (YB35470) to the south at the same time. Upon Mr. Dickson's death the Eagle and Dic claims were transferred to his wife Janet. Mrs. Dickson optioned the claims to Aurchem Exploration Ltd. in October 1994. In early 1996, BYG Natural Resources Inc. obtained an option to purchase all of Aurchem Exploration's claims located in the Mount Nansen area. In the summer of 1996, BYG carried out a large regional geophysical program, parts of which covered the Dic and Eagle claims.

In November 2011, Rockhaven Resources purchased Dic cl 1-7 (YA93470) and cl 101-106 (YB35475) and Eagle cl 1-12 (YB35415) from Aurchem Exploration Ltd. Airborne gamma-ray and magnetic geophysical surveys, as well as orthophotos, were carried out over the Klaza property in 2011, including the Dickson occurrence.

In 2012, Rockhaven drilled 8 diamond drill holes and performed trenching and soil sampling over the Dickson occurrence. In 2014, Rockhaven performed property-wide bedrock mapping, as well as ground EM and magnetic geophysical surveys at Klaza, which included the Dickson occurrence. Rockhaven performed soil and rock sampling at Dickson in 2016 and drilled 2 diamond drill holes in 2017 with follow-up diamond drilling in 2019.

Regional & Property Geology

The occurrence is located in the Dawson Range within Yukon-Tanana Terrane (YTT). The rocks of the YTT in this region consist of Early Mississippian metamorphic rocks separated into meta-sedimentary and meta-igneous suites (Stroshein, 1998). The meta-sedimentary suite consists of micaceous quartz-feldspar gneiss, schist and quartzite of the Nasina Assemblage. The meta-igneous package is comprised of biotite-hornblende feldspar gneiss and coarse-grained granodiorite orthogneiss with lesser amphibolite. These basement rocks are cut by numerous plutonic and volcanic events from the Cretaceous and Tertiary.

The oldest exposed unit within the boundaries of the Klaza property is a pluton of the Early Jurassic Long Lake Suite (EJL), which outcrops in the northeast corner. The majority of the property is underlain by coarse-grained, non-foliated Mid-Cretaceous Whitehorse Suite granodiorite (mKW) comprised of 30% hornblende and biotite. A moderate size, quartz-rich granite to quartz monzonite Casino Suite stock (LKq) intrudes the granodiorite in the southeast corner of the property and is thought to be the main heat source for hydrothermal cells responsible for mineralization on the property. A series of northwesterly trending feldspar porphyry dykes (LKfp) emanating from the stock in the southeastern part of the property cut the Whitehorse suite granodiorite in the Klaza occurrence area. These dykes are up to 30 m wide and consist of buff aphanitic groundmass containing up to 15% orthoclase phenocrysts (1 to 2 mm) with minor biotite and rare quartz phenocrysts. The dykes commonly occupy the same structural zones as the mineralized veins and are often strongly fractured. Some veins cross-cut dykes (Turner & Dumala, 2017).

Sub-aerial volcanic and volcanoclastic rocks belonging to the Mount Nansen (mKN) and Carmacks (uKC) volcanics are found on the periphery of the property. These rocks are believed to be extrusive equivalents of the mid and Late Cretaceous intrusions, respectively (Turner & Dumala, 2017).

Mineralization & Results

Mid-Cretaceous Mount Nansen Group pyroclastic volcanic rocks are intruded by mid-Cretaceous biotite-hornblende granodiorite of the Dawson Range batholith and numerous feldspar porphyry dykes. Sericite-carbonate and quartz-sericite alteration occurs along the volcanic-granodiorite contact and within the feldspar porphyry dykes. Narrower quartz veins and stringers cutting the pyroclastic rocks assayed up to 0.4 g/t Au while quartz-carbonate vein float containing sphalerite, galena, pyrite and minor chalcopyrite returned up to 123.4 g/t Ag. Soil samples collected by Kerr Addison were anomalous for antimony, arsenic, silver and gold.

BYG cut 3 grids; grids 1, 2, and 3 and then carried out ground VLF-EM and total field magnetics geophysical programs on each grid. The eastern portions of grids 2 and 3 covered portions of the Dic and Eagle claims. Numerous VLF-EM conductors and magnetic anomalies were found, but the lack of detailed geological mapping made interpretation difficult. BYG carried out preliminary soil sampling to try and follow up some of the geophysical targets but none of the lines covered the Dic or Eagle claims. Further work was cancelled when the company encountered financial problems.

The Dickson zone was tested by eight holes in two areas located approximately 1500 m apart in 2012. The deepest intercept was 100 m down dip of surface and returned 7.08 g/t Au and 127 g/t Ag over 1.00 m. Other significant intervals from the drilling in 2012 include 5.83 g/t Au and 132 g/t Ag over 1.35 m in KL-12-83 and 3.09 g/t Au and 78.6 g/t Ag over 3.38 m in KL-12-108.

Drilling in 2017 by Rockhaven Resources returned significant intercepts of up to 4.89 g/t Au and 38.6 g/t Ag over 0.62 m and 3.17 g/t Au and 40.4 g/t Ag over 0.98 m.
