

## Occurrence Details

**Occurrence Number:** 115J 029

**Occurrence Name:** Hole

**Occurrence Type:** Hard-rock

**Status:** Anomaly

**Date printed:** 8/6/2025 8:03:26 AM

## General Information

**Secondary Commodities:** copper, molybdenum

**Deposit Type(s):** Porphyry Cu-Mo-Au

**Location(s):** 62°42'19" N - -138°53'34" W

**NTS Mapsheet(s):** 115J10

**Location Comments:** .5 Kilometres

**Hand Samples Available:** No

**Last Reviewed:**

### Capsule

#### Work History

Staked by Coin Canyon Mines Ltd in Oct/69 as Hole cl 1-152 (Y39623), which were explored with grid soil sampling in 1970 and transferred to Coseka Resources Ltd and Hyland River Mines Ltd. Partially restaked as BCD cl 1-28 (Y76671) in Aug/73 by B. Fitch.

Restaked as I cl 1- 38 (YB37640) in Sep/92 by Pacific Sentinel Gold Corporation. Pacific Sentinel's main purpose in staking the claims was to protect numerous company owned placer claims and to provide an area for infrastructure planned for the neighboring Casino deposit (Minfile Occurrence #115J 028) located approximately 5 km to the northeast. Between 1993 and 94 the company carried out various geotechnical and environmental studies over the occurrence area.

In Nov/97 Pacific Sentinel merged with Consolidated North Coast Industries to form Great Basin Gold Ltd. In May/2000 Great Basin optioned 55 claims (Casino 'B' claims), including the surviving I claims to Wildrose Resources Ltd. As part of the agreement Wildrose agreed to assume responsibility for filing assessment work on 83 additional claims (Casino 'A' claims). Although Wildrose carried out various exploration programs on the Casino 'B' claims no work was carried out in the vicinity of this occurrence. Assessment requirements for this occurrence was fulfilled through the grouping of claims covering this occurrence with those claims covering Wildrose's neighboring Ana, Koffee and Aztec claims.

In Dec/2002 Wildrose optioned a 60% participating interest in its Canadian Creek property to Canley Developments Inc.

#### Capsule Geology

The occurrence is located approximately 5 km southwest of the Casino deposit (Minfile Occurrence #115J 028), one of the largest, highest grade porphyry deposits in Canada. The region is located within the Dawson Range, a west-central portion of the Yukon-Tanana terrane. The Yukon-Tanana terrane is comprised dominantly of metamorphic rocks inferred to be Devonian to Mississippian in age that has been intruded by numerous Mesozoic granitic bodies and plutons hosting copper, molybdenum and gold mineralization.

The occurrence area is underlain by hornblende-biotite diorite belonging to the mid-Cretaceous Dawson Range batholith, although geological reports by Coin Canyon Mines noted some metamorphosed sediments in the area. Soil and silt sampling by the company outlined a copper-molybdenum anomaly centered over the occurrence area.

Pacific Sentinel 's geotechnical and environmental studies identified the occurrence area as a possible borrow area for colluvial and residual sands. The material would used as construction material etc., if the neighboring Casino deposit obtains production status.
