

Occurrence Details

Occurrence Number: 1150 113
Occurrence Name: Bronson
Occurrence Type: Hard-rock
Status: Anomaly
Date printed: 4/29/2025 7:12:51 AM

General Information

Secondary Commodities: copper, lead, manganese
Deposit Type(s): Volcanogenic Massive Sulphide (VMS) Kuroko Cu-Pb-Zn
Location(s): 63°58'44" N - -139°28'40" W
NTS Mapsheet(s): 115014
Location Comments: 1 Kilometres
Hand Samples Available: No
Last Reviewed:

Capsule

Work History

Staked as Bronson cl (YA49997) in Jun/80 by Cominco, which performed mapping and geochem sampling in 1980 and bulldozer trenching in 1983. Cominco partially restaked as Bro cl (YA89024) in Apr/87 and conducted IP, VLF-EM and mag surveys and bulldozer trenching later in the year.

Capsule Geology

Several soil geochemical anomalies were outlined in an area underlain by quartz and feldspar augen-bearing quartz-muscovite schist and rusty weathering muscovite-quartz schist of the Permian Klondike Schist Assemblage (units Psa and Psqm, respectively). Galena-bearing quartz-carbonate vein float was found near the north end of the claims in 1983. Schist boulders containing stringers and disseminations of pyrite, chalcopyrite and galena were found in 1986. This latter style of mineralization gives a Permian Pb isotopic model age (Mortensen, unpub. data), and is interpreted as syngenetic VMS-style mineralization formed in felsic metavolcanic rocks now represented by the muscovite-quartz schist. The 1987 geophysical surveys outlined several anomalies on the south end of the property.
