

Occurrence Details

Occurrence Number: 1150 131
Occurrence Name: Cullen
Occurrence Type: Hard-rock
Status: Showing
Date printed: 12/15/2025 10:15:24 PM

General Information

Secondary Commodities: gold
Deposit Type(s): Vein Au-Quartz
Location(s): 63°52'0" N - -139°16'30" W
NTS Mapsheet(s): 115014
Location Comments: .5 Kilometres
Hand Samples Available: No
Last Reviewed:

Capsule

Work History

Staked as the Red Bird (384), Peacock (4014), Virginia (5709) and Ginger (4017) cl in September and October, 1899. Virginia and Ginger were re-staked as Homestake and Homestake No. 2 by 1904. By 1907, a 24 m adit had been completed on the Peacock claim and two shafts, 17 m and 5 m deep had been sunk on the Homestake claim with a 17 m drift at the bottom of the shallow shaft.

The occurrence was re-staked as the Vi cl (YA55285) in May, 1981 by Ebony Res L, which performed a photogrammetric survey in 1981. In 1983, the claims were transferred to Silvercrest Resources Corp., which performed geochemical sampling and hand pitting in 1984. The claims were transferred in 1985 to Dawson Eldorado ML, which trenched in 1990, and to Arbor Resources Inc. in November, 1990.

In August, 1992 Kennecott Canada Inc. optioned the Lone Star property (including the Vi claims) from Arbor. In 1994, the Vi claims received a cursory examination as part of a larger reconnaissance assessment of the Lone Star property. In January, 1995 Kennecott terminated its option agreement. In January, 1996 Arbor Resources Inc. changed its name to Klondike Gold Corp.

In March, 1996 Barramundi Gold Ltd staked OC cl 1-118 (YB68379) to the west over top expired Rado claims.

Capsule Geology

The occurrence is hosted by blocky weathering quartz augen-bearing quartz muscovite schist (unit Psa) of the Permian Klondike Schist Assemblage. Several small dykes of quartz-feldspar porphyry (unit eTqfp) intrude the schist. Foliaform metamorphic quartz sweats with minor pyrite and/or feldspar are abundant. Several crosscutting veins and stringers of quartz on the Peacock adit were sampled by MacLean in 1912. The stringers locally contain traces of pyrite, chalcopyrite, bornite, malachite and azurite. Early newspaper accounts reported that over thirty samples from the property had been assayed and ranged from 3 g/t to 219.4 g/t Au with considerable copper values.

Of the seven samples collected by MacLean, one assayed 0.7 g/t Au and the rest contained no values. A sample from the dump of the 17 m shaft at the Homestake claim also gave no values. The material on the dump of the 5 m shaft on the Homestake claim consists of schist with quartz and feldspar stringers. Some of the schist is reported to contain abundant chalcopyrite. One sample of dump material collected by MacLean contained 2.1 g/t Au.

Kennecott sampled the quartz veins and quartz feldspar augen schist/quartz muscovite schist and obtained no significant values.

Work History
