

## Occurrence Details

**Occurrence Number:** 095D 041

**Occurrence Name:** Toe-In

**Occurrence Type:** Hard-rock

**Status:** Anomaly

**Date printed:** 6/16/2025 1:12:04 AM

## General Information

**Deposit Type(s):** Skarn

**Location(s):** 60°55'0" N - -127°44'55" W

**NTS Mapsheet(s):** 95D13

**Location Comments:** .5 Kilometres

**Hand Samples Available:** No

**Last Reviewed:**

### Capsule

#### Work History

Discovered in 2009 by C. Roots of the Geological Survey of Canada during a regional geological mapping program.

#### Capsule Geology

C. Roots noted a small outcrop on the banks of the West Coal River consisting of fine grained, altered biotite granodiorite (Cretaceous?) intruding rusty-weathering pyritic, cherty hornfelsed sediments assigned to the undifferentiated Neoproterozoic to Cambrian Vampire – Narchilla Formations. Skarn and granodiorite coincide with a regional magnetic high.
