

Occurrence Details

Occurrence Number: 105D 218
Occurrence Name: Black Cub South
Occurrence Type: Hard-rock
Status: Deposit
Date printed: 6/15/2025 7:49:09 AM

General Information

Primary Commodities: copper, gold, molybdenum, silver
Aliases: Whitehorse Copper
Deposit Type(s): Skarn
Location(s): 60°34'15.6" N - -134°56'49.2" W
NTS Mapsheet(s): 105D10
Hand Samples Available: No
Last Reviewed:

Capsule

The Whitehorse Copper Belt is located west of Whitehorse and contains 30+ mines, deposits and showings. Many of the occurrences in the Copper Belt are skarns. The skarns form on or near the contact between the Whitehorse batholith and the Lewes River group. The Whitehorse batholith is commonly a grey coarse-grained hornblende granite and ranges from quartz monzonite to granodiorite to diorite. The Lewes River group contains numerous different rock types, most importantly of which is the limestone group, which is essential in the formation of skarns in the area. A small number of occurrences within the Copper Belt are vein and/or replacement and occur within the Whitehorse batholith granite.

The Black Cub South deposit is located at the contact between the Lewes river limestone and the Whitehorse batholith granite. The visible skarn is garnet rich and has minor amounts of bornite and malachite. Economic elements include Cu, Ag, and Au.

At the Black cub south deposit, 187 214 tonnes at 1.61% Cu was produced between 1970 and 1971.

Work History

Date	Work Type	Comment
12/13/2014	Pre-existing Data	
12/13/2008	Drilling
