

## Occurrence Details

**Occurrence Number:** 105D 226  
**Occurrence Name:** Spring Creek  
**Occurrence Type:** Hard-rock  
**Status:** Prospect  
**Date printed:** 12/16/2025 5:06:08 PM

## General Information

**Secondary Commodities:** copper  
**Aliases:** Whitehorse Copper  
**Deposit Type(s):** Skarn  
**Location(s):** 60°40'40.74" N - -135°7'31.97" W  
**NTS Mapsheet(s):** 105D11  
**Hand Samples Available:** No  
**Last Reviewed:**

### Capsule

The Whitehorse Copper Belt is located west of Whitehorse and contains 30+ mines, deposits and showings. By 1900, most of the important deposits had been discovered and the first small ore shipment was made that year. Many of the occurrences in the Copper Belt are skarns. The skarns form on or near the contact between the Whitehorse batholith and the Lewes River group. The Whitehorse batholith is commonly a grey coarse-grained hornblende granite and ranges from quartz monzonite to granodiorite to diorite. The Lewes River group contains numerous different rock types, most importantly of which is the limestone group, which is essential in the formation of skarns in the area. A small number of occurrences within the Copper Belt are vein and/or replacement and occur within the Whitehorse batholith granite.

At Spring Creek, the contact between the Lewes River limestone and Whitehorse batholith granite is marked by a skarn zone, which is up to 100 feet (30 m) wide in places. The skarn contains tremolite, garnet and epidote and mineralization includes malachite, azurite, bornite, chalcocite and chalcopyrite.

### Work History

Date	Work Type	Comment
12/13/1980	Drilling	7 holes completed
12/13/1980	Geochemistry	

### Assessment Reports that overlap occurrence
