

## Occurrence Details

**Occurrence Number:** 105D 229

**Occurrence Name:** Sue

**Occurrence Type:** Hard-rock

**Status:** Prospect

**Date printed:** 4/28/2025 8:06:46 PM

## General Information

**Primary Commodities:** copper, gold, molybdenum

**Aliases:** Whitehorse Copper

**Deposit Type(s):** Skarn

**Location(s):** 60°34'29.17" N - -134°53'57.62" W

**NTS Mapsheet(s):** 105D10

**Hand Samples Available:** No

**Last Reviewed:**

### Capsule

The Whitehorse Copper Belt is located west of Whitehorse and contains 30+ mines, deposits and showings. By 1900, most of the important deposits had been discovered and the first small ore shipment was made that year. Many of the occurrences in the Copper Belt are skarns. The skarns form on or near the contact between the Whitehorse batholith and the Lewes River group. The Whitehorse batholith is commonly a grey coarse-grained hornblende granite and ranges from quartz monzonite to granodiorite to diorite. The Lewes River group contains numerous different rock types, most importantly of which is the limestone group, which is essential in the formation of skarns in the area. A small number of occurrences within the Copper Belt are vein and/or replacement and occur within the Whitehorse batholith granite.

The Sue deposit is a skarn within a silicified limestone and carries chalcopyrite, bornite and some molybdenite. The majority of the mineralization is located on the southeast side of a small fault, which strikes N 50° E. A representative ore sample from the dump contained chalcopyrite, garnet, epidote, calcite and some molybdenite, and assayed for traces of gold, 5.3% Cu and 0.56% molybdenum.
