

## Occurrence Details

**Occurrence Number:** 105D 232

**Occurrence Name:** Copper Cliff

**Occurrence Type:** Hard-rock

**Status:** Showing

**Date printed:** 4/28/2025 4:34:54 PM

## General Information

**Primary Commodities:** copper

**Aliases:** Whitehorse Copper

**Deposit Type(s):** Skarn

**Location(s):** 60°35'34.04" N - -135°1'41.74" W

**NTS Mapsheet(s):** 105D11

**Location Comments:** From Copper Cliff summary report

**Hand Samples Available:** No

**Last Reviewed:**

### Capsule

The Whitehorse Copper Belt is located west of Whitehorse and contains 30+ mines, deposits and showings. By 1900, most of the important deposits had been discovered and the first small ore shipment was made that year. Many of the occurrences in the Copper Belt are skarns. The skarns form on or near the contact between the Whitehorse batholith and the Lewes River group. The Whitehorse batholith is commonly a grey coarse-grained hornblende granite and ranges from quartz monzonite to granodiorite to diorite. The Lewes River group contains numerous different rock types, most importantly of which is the limestone group, which is essential in the formation of skarns in the area. A small number of occurrences within the Copper Belt are vein and/or replacement and occur within the Whitehorse batholith granite.

The cliffs at Copper Cliff lake are home to an outcrop of garnet rich skarn about 10 feet wide and 20 feet long and is located along the contact between of the Lewes River limestone and Whitehorse batholith granite stock. The skarn contains bornite, chalcopyrite and specular hematite.
