

## Occurrence Details

**Occurrence Number:** 106D 102  
**Occurrence Name:** McKay Hill - Red  
**Occurrence Type:** Hard-rock  
**Status:** Prospect  
**Date printed:** 6/14/2025 5:03:34 PM

## General Information

**Secondary Commodities:** copper, gold, lead, silver, zinc  
**Deposit Type(s):** Epithermal Au-Ag-Cu: High Sulphidation  
**Location(s):** 64°21'36.14" N - -135°22'32.86" W  
**NTS Mapsheet(s):** 106D06  
**Location Comments:** Coordinate based upon the location of the Red No. 1 vein.  
**Hand Samples Available:** No  
**Last Reviewed:** May 8, 2019

### Capsule

#### Work History

The Red zone veins were likely discovered concurrent with exploration dating back to the early 1920s in the McKay Hill area. It is unknown which historic claim the Red occurrence was on. It has been explored since 2008 as part of the McKay Hill (see MINFILE 106D 038) project.

The Red occurrence was restaked as Snoose cl 1-20 (YC56719) in Jul/2007 by M. Bindig and subsequently entered an option agreement with Northex Ventures Inc. who completed reconnaissance prospecting, trench mapping/verification and geochemical rock sampling. In 2008 Northex Ventures completed additional prospecting, trench mapping and geochemical rock sampling, including locating historic mineral workings outside of the historic Central zone (MINFILE 106D 038) over the Bella (MINFILE 106D 100), Red, Falls (MINFILE 106D 103) zones, the Snowdrift Extension vein (MINFILE 106D 104) and White Hill (MINFILE 106D 037) showing.

In 2009, Northex Ventures Inc. was renamed Monster Mining Corp. whom staked the Snoose 21-90 (YD11201) claims in Aug/2009 to wholly expand the borders of the property. Monster Mining Corp. completed a YMIP-funded exploration program completed detailed mapping over the historic Central zone, collection and analysis of 140 soil samples, rock geochemical sampling, prospecting (including the Bella zone and White Hill showing) and petrographic work to verify host lithologies.

In Jul/2010, Monster Mining Corp. added the MK 1-54 (YD34936) claims to the northeast. No work program was recorded until 2011 whereby detailed structural mapping, rock sampling and helicopterborne SkyTEM time domain electromagnetic geophysical survey was completed by Monster Mining Corp. No work program was completed on the claims in 2016, at which time they changed their name to Metallic Minerals Corp.

In Oct/2017, Metallic Minerals Corp. expanded the McKay Hill property to the southeast adding the Snoose 91-116 (YF29091) claims. Metallic completed satellite imagery data collection over the property, mapping (1:250- to 1:30,000-scale), prospecting, geochemical rock sampling, hand-pitting over the No. 6 vein and soil sampling (including sampling over the Independence zone, MINFILE 106D 101).

In 2018, the MK 55-96 (YF29201) were added by Metallic Minerals to the west to cover tracked favourable Marmot Group stratigraphy. Metallic completed property-wide mapping and prospecting, cut 16 excavator and hand-trenches which were geochemically channel sampled, and widespread soil sampling (571 samples).

#### Capsule Geology

The occurrence area is situated on the northwest slope of McKay Hill near the headwaters of Red Gulch approximately 23.5 km northwest of McQuesten Lake. The area was regionally mapped by L. Green (1972) of the Geological Survey of Canada in 1961 as part of a helicopter-supported party known as Operation Ogilvie. The occurrence was interpreted to be underlain by deformed Upper Proterozoic to Lower Cambrian clastic rocks of the Hyland Group. However, industry mapping over 2009-2018 on the project resulted in the interpretation that the host-lithologies in the area are in fact siliciclastic and hypabyssal volcanic rocks interpreted to belong to the Cambrian to Silurian Marmot Group.

Known mineralization at the Red occurrence is described as vuggy, brecciated, white quartz veins with limonitic coatings and copper-oxide mineralization. The Red zone is currently comprised of three veins (Metallic Minerals; Sep/2018, Dec/2018 and Jan/2019 New Releases) and are hosted in iron-carbonate altered basalts.

The Red No. 1 and Red No. 2 vein were located in historic open-cuts/pits in 2008 but no significant results were reported. In 2018 the Red No. 3 vein was located via prospecting, it reported 19.6 g/t Ag, 0.02 g/t Au, 0.46 % Zn and 0.7% Cu (Metallic Minerals; Jan/2019 New Release). In addition, Metallic reported a significant soil anomaly covering the Red veins extending to the west (refer to Metallic Minerals; Dec/2018 New Release).
