

Occurrence Details

Occurrence Number: 106D 105

Occurrence Name: McKay Hill - West McKay

Occurrence Type: Hard-rock

Status: Showing

Date printed: 6/14/2025 4:58:10 PM

General Information

Secondary Commodities: copper, gold, lead, silver, zinc

Deposit Type(s): Epithermal Au-Ag-Cu: High Sulphidation

Location(s): 64°20'57.6" N - -135°24'39.4" W

NTS Mapsheet(s): 106D06

Location Comments: Coordinate based upon the location of the Chinook vein which was discovered during 2018 trenching on the property.

Hand Samples Available: No

Last Reviewed: May 8, 2019

Capsule

Work History

The occurrence was likely originally staked as, or just west of, the Carrie claim (14672) in Jun/22 by L.B. Erickson. The mineralized float covering part of the West McKay occurrence was likely discovered concurrent with exploration dating back to the early 1920s in the McKay Hill area. At the time of writing the only vein exposed in bedrock is the Chinook vein which was discovered as part of the 2018 trenching program.

The McKay Hill occurrence was restaked as Snoose cl 1-20 (YC56719) in Jul/2007 by M. Bindig and subsequently entered an option agreement with Northex Ventures Inc. who completed reconnaissance prospecting, trench mapping/verification and geochemical rock sampling. In 2008 Northex Ventures completed additional prospecting, trench mapping and geochemical rock sampling, including locating historic mineral workings outside of the historic Central zone (MINFILE 106D 038) over the Bella (MINFILE 106D 100), Red (MINFILE 106D 102), and Falls zones, the Snowdrift Extension vein (MINFILE 106D 104) and White Hill (MINFILE 106D 037) showing.

In 2009, Northex Ventures Inc. was renamed Monster Mining Corp. whom staked the Snoose 21-90 (YD11201) claims in Aug/2009 to wholly expand the borders of the property and cover the Falls occurrence. Monster Mining Corp. completed a YMIP-funded exploration program completed detailed mapping over the historic Central zone, collection and analysis of 140 soil samples, rock geochemical sampling, prospecting (including the Bella zone and White Hill showing) and petrographic work to verify host lithologies.

In Jul/2010, Monster Mining Corp. added the MK 1-54 (YD34936) claims to the northeast. No work program was recorded until 2011 whereby detailed structural mapping, rock sampling and helicopterborne SkyTEM time domain electromagnetic geophysical survey was completed by Monster Mining Corp. No work program was completed on the claims in 2016, at which time they changed their name to Metallic Minerals Corp.

In Oct/2017, Metallic Minerals Corp. expanded the McKay Hill property to the southeast adding the Snoose 91-116 (YF29091) claims. Metallic completed satellite imagery data collection over the property, mapping (1:250- to 1:30,000-scale), prospecting, geochemical rock sampling, hand-pitting over the No. 6 vein and soil sampling (including sampling over the Independence zone, MINFILE 106D 101).

In 2018, the MK 55-96 (YF29201) were added by Metallic Minerals to the west to cover tracked favourable Marmot Group stratigraphy. Metallic completed property-wide mapping and prospecting, cut 16 excavator and hand-trenches which were geochemically channel sampled, and widespread soil sampling (571 samples).

Capsule Geology

The occurrence area is situated immediately west of the Central Zone east of Falls Creek approximately 23.5 km northwest of McQuesten Lake. The area was regionally mapped by L. Green (1972) of the Geological Survey of Canada in 1961 as part of a helicopter-supported party known as Operation Ogilvie. The occurrence was interpreted to be underlain by deformed Upper Proterozoic to Lower Cambrian clastic rocks of the Hyland Group. However, industry mapping over 2009-2018 on the project resulted in the interpretation that the host-lithologies in the area are in fact siliciclastic and hypabyssal volcanic rocks interpreted to belong to the Cambrian to Silurian Marmot Group.

Known mineralization at the West McKay occurrence is currently comprised of 5 interpreted quartz-galenite veins. The only vein exposed in bedrock at the time of writing is the Chinook vein which was discovered in 2018 via trenching and channel sampling over 2 m reported 181.2 g/t Ag, 0.04 g/t Au, 18.45% Pb, 1.96% Zn and 0.4% Cu (Metallic Minerals, Jan/2019 News Release).

Four additional semi-parallel mineralized float trains north of the Chinook vein were located via prospecting during the 2018 program, three of which may be extensions of the No. 8, No. 9 and Bella veins comprising the western portion of the Central zone and Bella zone respectively. Sampling from these veins reported anomalous results but details are not currently available at the time of writing (Metallic Minerals, Jan/2019 News Release).

Soil sampling coverage of the West McKay occurrence highlighted an anomaly covering and west of the aforementioned veins. No further results are available at the time of writing.
