

Occurrence Details

Occurrence Number: 106D 112
Occurrence Name: Lynx
Occurrence Type: Hard-rock
Status: Anomaly
Date printed: 8/3/2025 9:59:47 AM

General Information

Secondary Commodities: gold
Aliases: Rau, Rackla
Deposit Type(s): Manto Au
Location(s): 64°12'59.98" N - -134°30'12.33" W
NTS Mapsheet(s): 106D02
Location Comments: Coordinates supplied by ATAC 2019
Hand Samples Available: No
Last Reviewed:

Capsule

Work History

Staked within R cl 1-1295 (YC68334) in July 2008 by ATAC Resources Ltd. The claims are part of the larger Rackla Gold Project and were staked following the discovery of gold mineralization in 2008 at the company's Tiger occurrence (MINFILE occurrence 106D 098) located 5 km to the southeast of the Lynx occurrence. Following staking, the company performed a helicopter-borne magnetic and variable-time domain electromagnetic survey over the newly staked area, including the Lynx occurrence.

In 2009, ATAC Resources carried out prospecting and a soil sampling grid over the Lynx occurrence. Follow-up soil sampling was performed in 2010.

Regional & Property Geology

The occurrence lies with the Rau Trend between the Dawson and Kathleen Lakes thrusts, which form part of a band of regional-scale thrust faults that imbricate rocks of Mackenzie Platform and Selwyn Basin. The occurrence area lies on the western margin of ancestral North America and is underlain primarily by shallow water carbonate and clastic sediment rocks of the Mid-Proterozoic to Paleozoic Mackenzie Platform and the Neo-Proterozoic to Paleozoic, regionally metamorphosed Selwyn Basin clastic rocks. These rocks formed a fault-bounded sediment package which was thrust northeasterly during Jurassic to Cretaceous times by the Dawson and Kathleen Lakes thrust faults onto predominantly Proterozoic rocks. Following thrust faulting, Late Cretaceous (94-90 million years) intermediate to felsic plutons of the Tombstone Suite were emplaced (Mortensen et al., 2000). A second compressional orogenic event around 65 million years saw the emplacement of felsic intrusives assigned to the McQuesten Suite.

Other than the immediate area surrounding the Tiger deposit (MINFILE occurrence 106D 098), the occurrence area has not been geologically mapped in detail. ATAC Resources (AR 096936) has mapped 3 main units in the area comprising the Rau Trend:

1. Cambrian to Ordovician massive, grey dolostone,
2. Ordovician and/or Silurian bedded, grey and buff silty limestone and massive white limestone, and
3. Silurian to Devonian thick, bedded dolostone and limestone.

The company has assigned all three units to the Cambrian to Devonian Bouvette Formation. Colpron's 2013 geological map generally supports this interpretation; however it uses slightly different age dates and doesn't include the oldest rocks (Cambrian to Ordovician dolostones) within the Bouvette formation.

Thin volcanoclastic horizons assigned to the Ordovician Marmot Formation are interbedded with the Ordovician and/or Silurian limestones and a narrow sliver of Mid-Proterozoic Fifteen Mile Group dolostone underlies the Bouvette Formation rocks to the southwest. Devonian and Mississippian Earn Group comprised of black shale and chert bounds the Bouvette Formation to the south east and north in the southern half of the Rau Trend property.

Mineralization at the Rau Trend varies and consists mainly of: sediment-hosted replacement-style Au; structurally hosted Ag-Pb-Zn; skarns; Au-bearing quartz veins; and transported gossans/unknown deposit style (AR 096936).

Mineralization & Results

The Lynx occurrence was discovered in 2009 by ATAC Resources and consists of limonite float within a limestone talus field. Prospecting samples returned up to 0.24 g/t Au, 7290 ppm As, 789 ppm Pb and 5970 ppm Zn. A sample collected 700 m to the east returned anomalous gold of 1.45 g/t Au (AR 096936).
