

## Occurrence Details

**Occurrence Number:** 106D 111

**Occurrence Name:** Serval

**Occurrence Type:** Hard-rock

**Status:** Showing

**Date printed:** 8/5/2025 6:33:54 PM

## General Information

**Secondary Commodities:** gold

**Aliases:** Rau, Rackla

**Deposit Type(s):** Manto Au

**Location(s):** 64°13'51.6" N - -134°30'10.67" W

**NTS Mapsheet(s):** 106D02

**Location Comments:** Coordinates supplied by ATAC 2019

**Hand Samples Available:** No

**Last Reviewed:**

### Capsule

#### Work History

Staked within R cl 1-1295 (YC68334) in Jul/2008 by ATAC Resources Ltd. The claims are part of the larger Rackla Gold Project and were staked following the discovery of gold mineralization in 2008 at the company's Tiger occurrence (Minfile Occurrence #106D 098) located approximately 5 km to the southeast. Following staking the company carried out a helicopter-borne magnetic and variable-time domain electromagnetic survey over the newly staked area.

In 2009 ATAC Resources carried out grid and contour soil sampling followed by prospecting and rock sampling of anomalous areas including the Puma occurrence. In 2010 ATAC Resources carried out a large exploration program on the Rau portion of its Rackla Gold property. The company completed air-borne ZTEM and aeromagnetic geophysical surveys over the majority of the Rau trend. ATAC also completed a soil sampling over the area.

ATAC carried our rock sampling over the occurrence area in 2015. No further work has been completed.

#### Geology

Regionally, the occurrence lies between the Dawson and Kathleen Lakes thrusts which form part of a band of regional-scale thrust faults that imbricate rocks of Mackenzie Platform and Selwyn Basin. The occurrence area lies on the western margin of ancestral North America and is underlain primarily by carbonate platform rocks of Mackenzie Platform which are in turn overlain by Paleozoic Selwyn Basin clastic rocks. The rock package formed a fault-bounded package which was thrust northeasterly during Jurassic to Cretaceous times by the Dawson and Kathleen Lakes thrust faults onto predominantly Proterozoic rocks. Following faulting, Late Cretaceous (94-90 million years), intermediate to felsic plutons of the Tombstone Suite were emplaced. A second intrusive event around 65 million years saw the emplacement of felsic intrusives assigned to the McQuesten Suite.

The Serval showing was discovered in 2015 by exploration crews prospecting northwest from the earlier explored areas. Crews reported variably silicified limonitic oxide float on a ridge top located 6 km along trend from the Tiger deposit. The float occurs in association with an area of intense calcite flooding proximal to a fault that prominently offsets stratigraphy. Gold values from hand samples collected in proximity to this fault returned a range of values from below detection to 1.44 g/t gold.
