

Occurrence Details

Occurrence Number: 106D 115

Occurrence Name: Jaguar

Occurrence Type: Hard-rock

Status: Anomaly

Date printed: 8/5/2025 6:03:35 PM

General Information

Secondary Commodities: gold

Aliases: Rau

Deposit Type(s): Manto Au

Location(s): 64°12'37.91" N - -134°27'9.55" W

NTS Mapsheet(s): 106D01

Location Comments: Coordinates supplied by ATAC 2019

Hand Samples Available: No

Last Reviewed:

Capsule

Work History

Staked within R cl 1-1295 (YC68334) in Jul/2008 by ATAC Resources Ltd. The claims are part of the larger Rackla Gold Project and were staked following the discovery of gold mineralization in 2008 at the company's Tiger occurrence (Minfile Occurrence #106D 098) located approximately 5 km to the southeast. Following staking the company carried out a helicopter-borne magnetic and variable-time domain electromagnetic survey over the newly staked area.

In 2009 ATAC Resources carried out grid and contour soil sampling followed by prospecting and rock sampling of anomalous areas including the Jaguar occurrence. In 2010 ATAC Resources carried out a large exploration program on the Rau portion of its Rackla Gold property. The company completed air-borne ZTEM and aeromagnetic geophysical surveys over the majority of the Rau trend as well as soil sampling over the Jaguar occurrence.

Further soil sampling was completed over the area in 2012, followed by prospecting and rock sampling in 2015.

Geology

Regionally, the occurrence lies between the Dawson and Kathleen Lakes thrusts which form part of a band of regional-scale thrust faults that imbricate rocks of Mackenzie Platform and Selwyn Basin. The occurrence area lies on the western margin of ancestral North America and is underlain primarily by carbonate platform rocks of Mackenzie Platform which are in turn overlain by Paleozoic Selwyn Basin clastic rocks. The rock package formed a fault-bounded package which was thrust northeasterly during Jurassic to Cretaceous times by the Dawson and Kathleen Lakes thrust faults onto predominantly Proterozoic rocks. Following faulting, Late Cretaceous (94-90 million years), intermediate to felsic plutons of the Tombstone Suite were emplaced. A second intrusive event around 65 million years saw the emplacement of felsic intrusives assigned to the McQuesten Suite.

The Jaguar showing is located on the southeast side of Monument Hill. Reconnaissance soil sampling carried out in the vicinity of the showing returned weak to moderately anomalous gold, arsenic, bismuth, lead and zinc values. A sample collected at the showing returned a peak values of 498 ppb gold while a second sample collected southeast down in the valley returned a value of 334 ppb gold. Follow-up prospecting and rock sampling found that gold mineralization typically occurs within dense goethite-rich limonite float scattered over a 200 m by 300 m area. Two rock samples from the showing returned values of 1.57 g/t and 2.8 g/t gold.

Prospecting carried out 350 m west of the showing in 2015, revealed a northwest trending linear located directly beneath a gossanous exposure. Float samples of oxidized limestone collected from this area in 2015 returned gold values between 0.01 to 2.55 g/t gold.
