

Occurrence Details

Occurrence Number: 116B 175

Occurrence Name: Goblin

Occurrence Type: Hard-rock

Status: Prospect

Date printed: 8/6/2025 1:46:26 AM

General Information

Secondary Commodities: copper, silver

Aliases: Arena, Monster

Deposit Type(s): Iron Oxide Copper Gold (IOCG)

Location(s): 64°50'34.89" N - -139°43'49.9" W

NTS Mapsheet(s): 116B13

Location Comments: Coordinates provided by Go Metals Corp. in 2019.

Hand Samples Available: No

Last Reviewed:

Capsule

Goblin Work History

Union Miniere Exploration and Mining Corporation Limited (UMEX) and Shell Canada Resources Ltd. first staked the Monster property as the DAS (1-42) and ID (1-72) claims in 1975. Regional geological mapping and soil sampling with Cu and Co analysis was performed in 1976 by UMEX over the DAS claims. The claims were briefly optioned to Rinsey Mines Ltd. in 1990; however, no work was performed.

The ID claims were re-staked as Monster cl 41-72 ("Monster East") in 1993 by Pamicon Developments Ltd. and Equity Engineering Ltd., who also re-staked the DAS claims as Monster cl 1-40 ("Monster West"). Monster Joint Venture optioned the claims in 1993 and performed geological mapping, prospecting and soil sampling over the entire Monster property.

Pendisle Resources Ltd., previously Monster Joint Venture, staked in Monster cl 73-265 in 1994 between the Monster East and West properties to create a contiguous claim block. They performed limited geological mapping and prospecting over the Monster East. The Cookie claims (1-20) located 2.5 km to the east-southeast of the Monster were also staked in 1994 and geological mapping, prospecting, and silt and soil sampling were carried out at this time.

In 1996, Blackstone Resources Ltd. (formerly Pendisle Resources) carried out helicopter-borne magnetic and radiometric gamma-ray geophysical surveys over the Ogilvie Mountain breccias, including the Monster property (Monster and Cookie claims). In 1998, Blackstone staked the Cookie cl 21-58 to the south and west of the original claims to create a contiguous claim block with the Monster claims, called the Monster property. Blackstone carried out prospecting and soil sampling over the entire Monster property during the 1998 exploration program to target magnetic and structural features outlined in the 1996 geophysics.

Blackstone Resources changed its name to Blackstone Ventures Inc. in 2001 before announcing a purchase agreement with Monster Copper Resources Inc., a private exploration company, who obtained a 100% interest. Monster Copper carried out geological reconnaissance, mapping, ground magnetic geophysics, and prospecting over the central and eastern portions of the Monster property in 2001. A similar work program was carried out in 2002 over the central and western portion of the property, which included mapping, ground magnetic geophysics, and rock geochemistry. Further gravity surveying was performed in 2003.

In 2007 Monster Copper Resources Inc. analyzed 1071 pulps of soil and rock samples collected by Blackstone Resources between 1993 to 1998 for U.

Go Metals Mining Corp., previously known as Gorilla Minerals and Go Cobalt Mining Corp., purchased the Monster Property in 2017 and performed geological mapping, soil sampling, prospecting, airborne magnetic and radiometric geophysical surveys and a Remote Spectral Geology (RSG) study over the entire property in 2018.

Regional & Property Geology

The Monster Property is centered on the Wernecke Breccia. The Wernecke Breccia are a 1.6 Ga set of megabreccias that occur over an area of 150 x 300 km in central Yukon. The breccias are variably IOCG altered and mineralized. The breccia zones were correlated to IOCG deposits on southern Australia based on lithological and temporal similarity (Thorkelson et al., 2001; Verbaas et al., 2018). The Wernecke Breccias in the Ogilvie Mountains were originally termed the Ogilvie Mountain Breccia (Lane, 1990), until Thorkelson et al. (2001) correlated both breccia sets and termed them the Wernecke Breccia in their entirety.

The Arena is centered on a bulls-eye radiometric K-U target (Go Metals NR, 2018). The Arena target is a relatively wide magnetic low with several mineralized zones within it. The Goblin showing, located within the Arena target, comprises a megacryst in the Wernecke Breccia that contains a carbonate-quartz stockwork with bornite, chalcocopyrite and minor cobaltite.

Mineralization & Results

The Goblin Showing was discovered through soil sampling in 1994 and subsequent geological work. The Goblin Showing is mostly inaccessible due to the relief in the immediate area. Mineralization consists of bornite, chalcocopyrite and cobaltite in a carbonate-quartz stockwork (AR93965).

A chip sample reported from the 1998 exploration program by Blackstone Resources yielded 0.57% Cu over 35m, including 1.63% Cu and 32.0 g/t Ag over 5 m.

Monster Copper's 2002 exploration season returned values of up to 3269 ppm Cu in a grab sample. Recent grab samples by Go Metals have yielded up to 1.7% Cu (J. Verbaas, personal communications).
